**MAX. TEMP.**

**NOTES:**

- <sup>a</sup> For January 1893, there are missing days of Maximum Temperatures on the 3rd and 10th. It's likely that the Maximum on the 10th was  $\leq 32^{\circ}$  and would extend the streak of 12 days to 19 days, possibly to 20 if the data on the 4th was also  $\leq 32^{\circ}$ . This would break the current record of 14 consecutive days from the seasons of 1965-1966 and 1978-1979.
- <sup>b</sup> On January 26, 1894, the Maximum Temperature was  $29^{\circ}$ , one of 7 individual days with a single day being the longest period remaining  $\leq 32^{\circ}$  during the 1893-1894 season. On January 25, 1894, the Maximum Temperature is shown as missing. It's possible that this may have resulted in 2 consecutive days with Maximum Temperatures remaining  $\leq 32^{\circ}$ .
- <sup>c</sup> The Maximum Temperature on February 3, 1895 is missing and was likely  $\leq 32^{\circ}$ , which would extend that streak to 12 days.
- <sup>d</sup> The Maximum Temperature on January 4, 1896 is missing, and possibly  $\leq 32^{\circ}$ , which would extend that streak to 6 days.

## OVERALL

### NOTES:

- 1) Years with duplicate periods have the dates in chronological order.
- 2) For the period 8/1871-7/1872, no Minimum Temperature data is available but the First and Last Occurrence Dates are known.
- 3) Maxima are shown in **Bold Red** text, Minima in **Bold Blue** only for the categories "Number of Days  $\leq 32^{\circ}\text{F}$ ." and "Min. Temp. During Streak" and the Chart.
- 4) Cells with gray backgrounds indicate missing or incomplete data.
- 5) Cells with this color background indicate the longest streak of the current season.
- 6) The Chart Trendline, shown in **bright green**, is Linear, with associated equation and R-Squared values portrayed.

7) This temperature data for Baltimore includes downtown locations (8/1/1871-7/22/1950), then for Baltimore-Washington International Thurgood Marshall Airport (BWI) from 7/23/1950-Present (formerly-named 'Friendship International Airport'). The differences in the weather instrument sitings between the urban location (including attached to the outside of a window and on a dark-colored rooftop) and the suburban airport (initially, on the roof - see NOTE 8, below) often result in large temperature differences but the National Weather Service/National Centers for Environmental Information's official long-term historical archive for Baltimore is maintained in this record. Due to these climate differences, note the time periods when viewing the chart & trendline. There was also a 'U.S. Weather Bureau Airport Station' located on the Baltimore City/Baltimore County boundary at Dundalk from 7/1/1939 until moving to then-named 'Friendship International Airport' on 7/23/1950 but that original airport station data is not included in this table.

8) Per the December 1964 Local Climatological Data - Baltimore, Maryland publication for then-named 'Friendship International Airport,' "Maximum-Minimum Temperatures taken on the roof of the terminal building (54 feet above the ground) until Dec. 22 [1964] and 6 feet above the ground thereafter."

9) Though these tables are specifically for freezing temperatures of  $\leq 32^{\circ}$ , if the threshold were increased by just one degree to  $\leq 33^{\circ}$ , it would extend the Minimum Temperature streak from 47 days to 63 days, occurring during the 2010-2011 season for the period 12/13/2010-2/13/2011, with  $33^{\circ}$  readings occurring on 1/2/2011 and 2/5/2011. A 57-day streak occurred in the 1983-1984 season, covering the dates of 12/16/1983-2/10/1984, with  $33^{\circ}$  readings on 1/6/1984 and 1/25/1984. For Maximum Temperatures of  $\leq 33^{\circ}$ , it only increases the current record of 14 days of  $\leq 32^{\circ}$  (during seasons 1965-1966 and 1978-1979) to 15 days for the period 1/24/1966-2/7/1966.
