2) Storm Event Database (NCEI):

3) National Weather Service - Baltimore/Washington (Sterling, VA):

4) National Weather Service - Philadelphia/Mt. Holly (PA/NJ):

5) National Weather Service - Wakefield (VA):

6) National Weather Service - Pittsburgh (PA):

DATA NOTE: A total of 439 tornadoes have been documented from 1/1/1950-8/22/2026

The previous F-Scale was used from January 1950-December 2006, the current EF-Scale was implemented in January 2007.

PROPERTY DAMAGE NOTE: Estimated Property Loss - Prior to 1996 this is the categorization of tornado damage by dollar amount:

0 or blank - unknown; 1=<\$50; 2=\$51-\$500; 3=\$501-\$5,000; 4=\$5001-\$50,000; 5=\$50,001-\$500,000; 6=\$500,001-\$5,000,000; 7=\$5,000,001-\$50,000,000; 8=\$50,000,001-\$500,000,000; 9=>\$500,000,000.

From 1996 to the present, tornado property damage is shown in millions of dollars. Entries of 0 do not necessarily mean \$0.

UPDATE: Actual Damage Estimate Values were subsequently extracted from the Storm Events Database for the two periods, 1/1979-12/1993 and 8/1994-12/1995. For the period 1/1994-7/1994, the data still follows the previous Estimated Property Loss number categorization due to the Storm Events Database not containing the 15 tornadoes that occurred in July 1994.

Regarding Estimated Property Damage, a paper entitled "When Do Losses Count? Six Fallacies of Natural Hazards Loss Data" was published in the June 2009 edition of the American Meteorological Society's BAM publication regarding the difficulties in providing accurate values:

<https://www.spc.noaa.gov/wcm/data/2008bams.pdf>

GENERAL NOTES: 1) Gray rows indicate years without any reported tornadoes.

2) The "State Tornado Number of Year" values are listed chronologically. The original values may be different due to re-evaluation, late reports, etc.

3) Crop damage began reporting in 2007 but research has found some earlier damage estimates and are included for those earlier years.

4) The tornado path lengths for "cross-state" occurrences are only for the Maryland portions.

5) All of the above data sources have been researched, with some having differing information, including whether original reports were revised with additional information or others having reported tornadoes that were later nullified as such. The Storm Prediction Center was previously contacted about whether their information is the standard - the reply was that the National Weather Service's surveys are what should be followed. The above table represents the best possible information that could be researched and deciphered from all official sources.

6) For the tornadoes occurring on April 16, 2011 in Frederick and Carroll Counties, the Storm Events Database shows 3 main damage segments (4 separate tornado paths with coordinates, three in Frederick County and one crossing from Frederick County into Carroll County). A subsequent National Weather Service survey combines these separate tracks into a single tornado, noting that they "were classified per NWS standards as a single tornado...but likely were caused by three distinct vortices." However, though the NWS's Storm Event Database states that they consider these 4 damage areas are from a single tornado but from different vortices, the distance between the end of the 2nd segment and the beginning of the 3rd segment is nearly 1.5 miles (the 3rd segment is ESE from the end of the 2nd segment). Due to this large distance, it's decided, for this archive, that these should be considered 2 separate events so split out segments 3 and 4 into a second tornado. Note that a separate tornado occurred on this same date in northern Carroll County, not associated with the one that crossed from Frederick County.

7) * The EF-2 tornado that struck the Annapolis area on September 1, 2021 caused damage along its 11.43 mile path, with touchdown in Owensville, 3 miles west of Galesville in southern Anne Arundel County, then moving northward through the western side of Annapolis. Most of the significant damage occurred in the Edgewater-to-Annapolis portion. As of 12/23/2025, property damage value has yet to be provided as both the Storm Report and Storm Prediction Center databases continue to show \$0.00 losses. If this event's damage estimate is eventually provided, it will be added to this table.

8) On July 1, 2025, severe weather affected southern Maryland, with tornadic activity in St. Mary's County. A preliminary National Weather Service Damage Survey was issued on July 2, 2025 for the EF-0 Beauvue Tornado Event. On July 11, 2025, a second NWS Damage Survey for July 1, 2025 was issued for the EF-1 Breton Bay Tornado Event. At first, it appeared to be an update of the original Beauvue tornado. An email was sent to NWS-Sterling asking if these were two tornadoes or if this new Damage Survey was simply an update to the original survey - no response has ever been received. The NWS Storm Events data now only lists the EF-1 and that survey mentions, "The tornado took a path directly along the water-land interface, becoming a waterspout on the coves along Breton Bay, then returning ashore as a tornado," yet the Storm Event database doesn't list any waterspouts. When geopositioning the two tornado track survey coordinates, it appears the beginning and ending coordinates are sufficiently different to include them as separate tornadoes and this archive was been updated to reflect this. Should this information be revised, it will be updated in this archive.
